

SEPTEMBER 16, 2022

Today we will review material in sections 2.4–2.5 of the book.

Recall that we say

$$(1) \quad \lim_{x \rightarrow a} f(x) = \infty$$

if we can make the value $f(x)$ be infinitely large by choosing x to be sufficiently close to a . Similarly, we can define

$$(2) \quad \lim_{x \rightarrow a} f(x) = \pm\infty, \quad \lim_{x \rightarrow a^\pm} f(x) = \pm\infty.$$

In any of these cases we call the line $x = a$ a vertical asymptote of the function f .

0.0.1. Challenge question. If $\lim_{x \rightarrow a} f(x) = \infty$ and $\lim_{x \rightarrow a} g(x) = -\infty$ then what can we say about $\lim_{x \rightarrow a} (f(x) + g(x))$?

Example 0.1. Compute the following limit (if it exists)

$$(3) \quad \lim_{x \rightarrow 0} \left(\frac{1}{x} - \frac{1}{x^2} \right)$$

Example 0.2. Compute the following limit (if it exists)

$$(4) \quad \lim_{x \rightarrow 0} \left(\frac{1}{x} - \frac{2x+1}{x} \right).$$

Example 0.3. Define the function

$$(5) \quad f(x) = \frac{x^2 - x - 2}{x - a}$$

where a is some number. For which values of a do the following limits exist.

- $\lim_{x \rightarrow a^+} f(x)$.
- $\lim_{x \rightarrow a^-} f(x)$.
- $\lim_{x \rightarrow a} f(x)$.

0.0.2. Recall that we say

$$(6) \quad \lim_{x \rightarrow \infty} f(x) = L$$

if we can make $f(x)$ as close to the value L for x a large enough number. In this case we say that $y = L$ is a horizontal asymptote of the function f .

Example 0.4. Find the limit (if it exists)

$$(7) \quad \lim_{x \rightarrow \infty} \frac{x^2 + 2x + 1}{4x^2 + 5}$$

Example 0.5. Find the limit (if it exists).

$$(8) \quad \lim_{x \rightarrow \infty} \frac{e^x \sin x}{e^{2x} + 1}$$
